Block access to ip address

Escrito por crowek123 - 11/07/2018 04:36

_____

Hello,

We have an unknown virus which starts from a file called thumbs.db2. We now know this file tries to access online-upd.at port 443 ip 87.117.205.62 which then seems to mutate the virus. Can i use the firewall in cloud office protection to block access to this ip address? if so, how? if not, does anyone have a suggestion? Panda does seem to be detecting this file from today but i'm concerned if it has been communicating to this site that it is finding other ways to infect us that are also unknown.

Any help will be apprecited.

I didn't find the right solution from the Internet.
